Patent No. 6210950
GENERAL INFORMATION:
APPLICANT: Johnson, William G.
APPLICANT: Stenroos, Edward S.
TITLE OF INVENTION: METHODS FOR DIAGNOSING, PRI;
TITLE OF INVENTION: DEVELOPMENTAL DISORDERS
FILE REFERENCE: 601-1-057
CURRENT APPLICATION NUMBER: US/09/318,448
CURRENT FILING DATE: 1999-05-25
NUMBER OF SEQ ID NOS: 46
LENGTH: 390
TYPE: DNA
ORGANISM: Artificial Sequence
FEATURE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            : PatentIn Ver. 2.0

/clone=Vector: lambda zip-Lox; Site_l: Sal; Site_2: Not;
Lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark-rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
sliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
oligo dT primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   thale cress.

University of Missouri, Columbia. A cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors). "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonicleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114 gblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

The structure and function of the expressed portion of the wheat genomes - Anther cDNA library from rye
/note-"Organ: breast; vector: pucl8; Site_1: Smal; Site_2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196 ,716 - Ludwig Institute for Cancer Research) profiles into the DUC 18 vector. Reverse transcription of tissue markha and cDNA amplification were performed under low markna end cDNA applification were performed under low a 124 c 89 g 4 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DEM 94335

Site_1: EcoRI; Site_2: XhoI; Plants were grown in the greenhouse. Authers were harvested and pooled from early meiosis to late melosis. The tissue, total RNA, and poly(A) RNA were prepared (Buller, Ross and Gustafson) at University of Missouri, Columbia. A cDNA library was made, and the CDNA clones were in vivo excised to give pBluescript pagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Penton) at the University of California, Riverside. In the OD Anderson lab (all other authors). The Loss, Penton and DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors). The Action of California and DNA sequencing were performed of the OD Anderson lab (all other authors). The Action of California and DNA sequencing were performed of the OD Anderson lab (all other authors). The Action of California and DNA sequencing were performed in the OD Anderson lab (all other authors). The Action of California and DNA sequencing were performed on the OD Anderson lab (all other authors). The Action of California and DNA sequencing were performed on the OD Anderson lab (all other authors). The Action of California and DNA sequencing were performed on the OD Anderson lab (all other authors). The amino acid sequence is that of bacterial amylase A-180 which is

~

```
47;
used to prepare maltopentose (G5) in high yields by hydrolysis of starch. It can be modified to ensure its excretion, obviating the need to concentrate and purify the enzyme, i.e. the culture supernatant can be used directly for G5 prodn. G5 yields of over 90% are possible, eliminating the need for further G5 purification. G5 is used in medical and for converting (by esterilication) fatty acids to water-soluble form, suitable for use in stable infusion solns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          969 vttqekpegnlvtiyykkgfdtpymhyrpeggewtivpgirmeeselagyskltvdirea 1028

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of the mutanase enzyme, comprising the a PT box, which decomposes the alpha-1,3 glucoside bond of mutan. The mutanase enzyme is used in the method of the invention for prevention and removal of plaque and bacteria on teeth.

The invention relates to a recombinant cellulase active protein free of proteinases of native thermophilic and alkalinophilic origin, comprising the truncated sequences Cel B5, Cel B4/5, Cel B1, Cel B12/3, Cel 12/3, Cel 6 or Cel 59765, or a stability region from one of the defined full-length sequences, or functional equivalents. Cel B5 extends from amino acid A1011 to P1424 or K1425 or N1426, and Cel B4/5 extends from amino acid K635 to N1426 in the sequence shown in A4713492, Cel E1 extends from amino acid X99 to D481, Cel E6 extends from maino acid V1233 to K1751 and the stability region extends from maino acid V1233 to the sequence shown in A4713493, Cel E1/2 extends from maino acid V1233 to the sequence shown in A4713493, Cel E1/2 shown in A4713494. The new enzymes are useful in laundry detergent compositions to prevent or remove staining, backstaining or graying, for use on cellulosic materials including cotton-containing fabrics. They are especially useful processing of textiles where cellulose breakdown is required. The new processing of textiles where cellulose breakdown is required. The new contained enzymes show reduced redeposition of dye compared to using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptide (see AAN90395) with isoamylase activity. The DNA is obtd. from Pseudomonas amyloderamosa, pref. strain SB-15, and expresse recombinantly. The polypeptide has mol. wt. 75-85 kD and isoelectric point 4.6-4.8. It is used, together with beta-amylase, to convert amylaceous materials to high maltose prods. from which high purity maltose can be recovered. See AAP90610, AAN90390 for signal peptide.

New nucleic acids and proteins isolated from the non-thermophilic crenarchaeote Cenarchaeum symbiosum, useful in characterizing the physiology of these archae and in therapeutic, industrial or laboratory techniques -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cenarchaeum symbiosum open reading frame protein sequence SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAA55186 to AAA55226 and AAY90913 to AAY90951 represent nucleic acids and proteins isolated from the non-thermophilit cranarchaedcte. Cenarchaeum symbiosum. The nucleic acids and proteins identified in the present invention are useful in characterising the physiology of these archae and can be used in therapeutic, industrial or laboratory techniques. AAA55227 to AAA55260 represent promoter sequences from Cenarchaeum symbiosum. AAA55261 to AAA55269 represent PCR primers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ngps----lgdsnsiyvayn-----gwsssvtftlpappsgtqwyrvtdt 706

This sequence represents an isoamylase amino acid sequence. Isoamylases are debranching enzymes which hydrolyse alpha-1,6-D-glucosidic branch linkages in amylopectin. This sequence represents a parent enzyme from which genetically engineered variant debranching enzymes can be created. The genetically engineered enzyme has an improved thermostability at a pH confidence of 4-6 compared to the parent enzyme. The modified enzyme and or glycogen compared to the parent enzyme. The modified enzyme and or glycogen compared to the parent enzyme. The argin anylopectin and or glycogen compared to the parent enzyme. The starches such as corn, potato, wheat, manico and rice starch are useful when starches such as corn, potato, wheat, manico and rice starch are used as starting materials in commercial large scale production of sugars, such as high fructose syrup, high maltose syrup, maltodextrins, amylose, (4-66 oligosaccharides and other carbohydrates such as fat replacers. The chermostable debranching enzymes of the invention make it possible to perform liquefaction and debranching using the thermostable debranching carcharitication step. By debranching using the thermostable debranching enzyme variants during liquefaction together with the action of an alpha-amylase, the formation of panose precursors is reduced, thereby reducing the panose content in the final product and increasing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Variant bacterial pullulanases and isoamylases having, e.g. increased thermostability, used for converting starch from potatoes into high fructose svrnn
                                                                                          Isoamylase; debranching enzyme; amylopectin; thermostable; corn; genetically engineered variant; wheat; potato; wheat; manioc; rice starch; sugar production; high fructose syrup; high maltose syrup; maltodextrin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Svendsen A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 29; Fig 3; 116pp; English.
Isoamylase amino acid sequence.

                                                                                                                 The invention relates to novel human secreted polypeptides. The polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic accentation, testing and therapy, and can be used as nutritional supplements. They may be used to
                                                                                                                                                                                                                                                                                                                                                                                                         increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AMUS9510-AMU33304 represent the amino acid sequences of novel human secreted proteins of the invention.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Conduct amino acid sequences of the invention of mutations diagnostic amino acid sequences of the invention.

Conduct man acid sequences of the invention.

Conduct while was obtained in electronic format directly from WIPO at the vipo int/pub/published_pct_sequences.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsorlatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; thrombolytic; immunosuppressant; antidinabetic; hypotensive; dermatoblytic; coagulant; vasofant; thrombolytic; antidinabetic; hypotensive; dermatological; immunosuppressive; antidinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antiansemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The

This invention relates to defence-related signalling genes isolated from the sunflower (Helianthus annuus). The genes encode a neoxanthin cleavage charge (NCE), an amino acid permease (AAP) and a glutamic acid rich protein (NCE). The signalling gene is useful for increasing the resistance of a plant to a pathogen such as fungus, virus, bacterium, nematode or insect (e.g. European corn borer), preferably sclerotinia spp., Phoma spp., or Phomopsis spp. by stably incorporating a construct containing the gene into the genome of the plant. The gene is useful for regulating gene expression in a plant, in response to a stimulus such as infection with a pathogen, damage from a pathogen, hydrogen peroxide, jasmonic acid, methyl jasmonate, salicylic acid, oxalic acid or expression of a gene encoding oxalic acid oxidase. The genes are also useful for stem preferred regulation of gene expression in a plant. The genes are useful in proved agronomic traits, for modifying a plant. The genes are useful in proved agronomic traits, for modifying abscisic acid (ABA) metabolism and for modifying amino acid transport and content in plants. The present sequence represents a glutamic acid rich protein (GRP) like protein isolated from Synechocystis sp. The protein is such abe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               35;

                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotides encoding bone marrow tissue polypeptides. The sequences of the invention can be used in the tissue polypeptides. The sequences of the invention can be used in the tissue polypeptides. The sequences of the invention as parkinson's disease, Alzheimer's disease, Huntington's disorders and amyotrophic lateral sclerosis, peripheral nervous system disorders such as peripheral nervous system disorders such as peripheral characteristic, bone degenerative disorders, periodontal cisease, cerebrovascular disorders such as stroke, viral infections, bacterial infections, fungal infections, autoinfmune disorders such as rheumatoid arthritis, multiple sclerosis, asthma and ecsema, inflammatory disorders such as crohn's disease and nephritis, hyperproliferative disorders such as sporiasis, cognitive disorders, depression and cancer (e.g. tumours of the stomach, colon, panoreas, liver, bladder, prostate, ovary, kidney, brain and skin). The sequences are also useful in bone, cartilage, tendon, ligament and/or nerve tissue growth or regeneration and in healing of wounds, burns, incisions and ulcers. Sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The flocculation protein is used in a method to immobilise enzymes to a microbial cell wall. The coding sequence (FLO 1) is used in the production of a recombinant polynucleotide which comprises a structural gene encoding a protein with catalytic activity and at least part of a gene encoding at least the C-terminus of a protein capable of anchoring in a eukaryotic or prokaryotic cell wall. The anchoring fragment or protein is selected from alpha agglutinin, AGA 1, FLO 1, major cell wall protein of lower eukaryotes or a proteinase of lactic acid bacteria. The recombinant polynucleotide preferably also comprises a sequence encoding a signal peptide to ensure secretion of the expressed product. The signal peptide to protein, alpha factor, alpha-agglutinin, invertuse or inulnase, alpha-amylase of Bacillus or proteinases of lactic acid bacteria. The host microorganism can be used for performing enzymatic processes on an industrial scale.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
